

Overview

At Confluxe, we're building AI-powered commerce experiences that help customers discover the right products effortlessly.

Your task is to build a **Personal Shopping Assistant** that understands natural language shopping requests and recommends relevant products from a given product catalogue.

The emphasis is on creating an intuitive user experience backed by thoughtful engineering and intelligent decision-making

Problem Statement

Users should be able to describe what they are looking for in plain English, just as they would ask a shopping expert.

For example:

*"I am going for a trek to Hampta Pass in the last week of October for one week.
Please find me trekking essentials and clothing."*

"Find me good traditional wear for my friend's wedding in March next year."

"I need a premium gifting hamper for my parents' 25th anniversary next month."

Based on the user's request, your application should recommend the most relevant products available in the catalogue.

The assistant should be capable of interpreting user intent rather than relying solely on keyword matching.

Expected Features

Your solution should include:

- A conversational input where users can describe their shopping needs.(single webpage)
- Intelligent interpretation of user intent.
- Product recommendations grouped into relevant categories where applicable.
- A brief explanation for why each recommendation was selected.
- Links to the recommended products.

The assistant should gracefully handle incomplete or ambiguous requests and make reasonable assumptions where appropriate.

Product Catalogue

This assignment will require you to find catalogue data from the public domain or generate it.

Technical Expectations

You're free to choose your preferred technology stack.

Your submission should demonstrate:

- Well-structured backend architecture
- Well-structured frontend (single page)
- Clean API design
- Good code organisation
- Maintainability and scalability
- Thoughtful use of AI/LLMs where appropriate.

Deliverables

Please submit:

1. Source code.
2. README containing:
 - Setup instructions
 - Architecture overview
 - Design decisions
 - AI approach
 - Known limitations
 - Future improvements
3. A short demo video.
4. If deployed, include the live application URL.

Evaluation Criteria

Area	Weight
Problem Solving & Engineering Judgement	35%
Backend and Frontend Architecture & APIs	30%
AI & Recommendation Quality	25%
Code Quality & Documentation	10%
